The flex-grow property in CSS is used within a flex container to specify how much a flex item should grow relative to the other flex items in the container. It defines the ability of a flex item to grow to fill the available space in the flex container.

The flex-grow property is applied along the main axis of a flex container. The flex-grow property determines how much a flex item should grow along the main axis to fill the available space.

| Class | Properties |
|--------|-------------|
| grow | flex-grow: 1; |
| grow-0 | flex-grow: 0; |
