The flex-shrink property in CSS is used within a flex container to specify how much a flex item should shrink relative to the other flex items in the container when there isn't enough space available.

The flex-shrink property applies to the main axis of a flex container. It determines how much a flex item should shrink along the main axis when there isn't enough space to accommodate all the flex items.

Class	Properties
shrink	flex-shrink: 1;
shrink-0	flex-shrink: 0;
